

NEW LEAF PAPER®

New Leaf Green Notes™

New Leaf Green Notes™, the sustainably created memo books that help save endangered trees. These durable products are crafted with 100% post-consumer recycled fiber, processed chlorine free, printed with vegetable inks, are vegan, and feature 3 saddle stitches per unit.

Retail 3-packs of pocket-sized products are available in a variety of page formats, and feature sophisticated embossed covers highlighting an endangered tree in North America. The inside back covers provide information on these endangered trees, and how we all can help to ensure their survival.

3% of proceeds from these products benefit non-profit organizations working to save endangered trees in North America.

New Leaf Green Notes™ are sustainably crafted with durable high quality materials.

- 100% Post-consumer recycled fiber
- Processed chlorine free

3% of proceeds from New Leaf Green Notes™ are donated to these non-profit organizations:

The American chestnut was an essential component of the entire eastern U.S. ecosystem. This late-flowering, reliable, and productive tree is unaffected by seasonal frosts and was the single most important food in America for a wide variety of wildlife from bears to birds.

Mature American chestnuts have been virtually extinct for decades due to disease. The disappearance of these trees has resulted in a profound change in the composition of forests in the eastern United States.

The American Chestnut Foundation is working for a robust eastern forest restored to its splendor and the return of the iconic American chestnut to its native range. [LEARN MORE](#)

REDWOOD
FOREST
FOUNDATION
INC.

Redwoods are the tallest and largest trees on the planet. They support unique biodiversity including greenery, fungi, other trees, endangered wildlife, and birds. The shade these trees provide helps filter the water in rivers and streams benefitting fish.

Redwood forests store more carbon than other forest ecosystems. Only 5% of the original Redwood range remains today.

The Redwood Forest Foundation Inc. is working to restore local connection and control, ecosystem health and diversity, economic opportunity, and climate resilience throughout the Redwood Region. [LEARN MORE](#)

HOLDEN
FORESTS &
GARDENS

Ash trees are a vital component of North American forests. They provide habitat and food for animals, insects, and pollinators.

Emerald Ash Borers arrived in the 1990s on infested shipping pallets. These harmful insects have killed millions of Ash trees across 36 states in the Midwest and Eastern United States, and 5 Canadian Provinces.

The Great Lakes Basin Forest Health Collaborative connects efforts across federal agencies, conservation groups, researchers, and members of the public who are working together to save trees. This organization is breeding and replanting pest-resistant trees that will ensure the sustainability of our forests for the future. [LEARN MORE](#)
